...put some kind of a glass ceiling on prices.

In addition, we are seeing less **auction** situations today than perhaps two or three years ago. The **auction** climate sometimes drives up prices artificially because of its competitive nature.

Azria: There is definitely...

...opposed to financial buyers, you see them willing to pay up a little bit more. **Auctions** are not occurring as often as a few years ago, but we are seeing defensive situations in which the targets are turning to **auctions**. The solicitation of bids goes out after a hostile offer has been made. But I think the number of participants in those **auctions** is down. So, while the prices have inched up somewhat, they are not reaching the...sold and they later pass through the seller's estate.

Financial purchasers sometimes have trouble **matching** this benefit, for **sellers**. So, a combination of hot share prices and tougher tax laws drives many players toward...

...repurchases, up 70% from the year before. And the buyback boom continues in 1997. It **shows** that strategic **buyers** still have fuel to burn - if the right targets emerge.

Azria: Still another element is...market.

Groll: It is really a matter of how you characterize it. There are fewer **auctions** today and the **auctions** that are held are getting fewer bids. Does that mean that it is not an...

...one indication recently of how much of a seller's market it is - we are **auctioning** a public company right now where we had 26 indications of interest. There are 10...

Experts predict that recent moves toward electronic communications networks (ECNs) and other factors could cause trading in secondary markets to change more in the next five years than it has in the past 200. Shifts in the U.S. capital markets, while vexing to Wall Street, have proven beneficial to companies that offer alternatives to costly underwriters. ECNs are order **matching** systems that allow **buyers** to **view** bids and offers via a computer network. Because they offer anonymity, lower costs, and faster trades, electronic networks are bringing down prices and may be the future of securities markets. ECNs also help enforce order handling rules set up by the SEC to provide competition in exchanges by forcing NASDAQ dealers to show customer limit orders. Posting prices and sizes of customer orders makes supply and demand trends in the market more apparent. ECNs are also forcing exchanges including the NYSE to implement the Congress-commissioned Intermarket Trading System (ITS), which is intended to connect markets, making all bids for stock executable with offers to sell, regardless of bidding location. While this is a move towards competition that some exchanges do not want, electronic networks are helping to enforce standing laws and policies. More proposed competition-bolstering rules and further developments in the technology will open the doors for electronic communications networks to revolutionize U.S. securities market.

Abstract: Fingerprinting is a process that embeds **identifiers** of the **buyers** of data into the data. It enables buyers who copied and redistributed data illegally to be identified from the redistributed data.

An essential requirement for fingerprinting is the prevention of false accusations, i.e., honest buyers should not be accused even when fraud has been committed by merchants and third parties. Previous fingerprinting methods either could not meet this requirement or met it at a high cost, such as that associated with the use of independent servers for fingerprinting. The paper proposes to embed buyers' digital signatures into data and to **identify** illegal **buyers** by verifying signatures in the redistributed data. The security of the signature verification is discussed, assuming that the redistributed data have been modified by the illegal **buyers**. The paper **shows** that the proposed method can prevent false accusations at an acceptable cost. (10 Refs)

Increasing numbers of e-commerce Web sites, including cattle **auctions** and retail stores, are using live cameras that allow shoppers to see items in real time through live video feeds. Live video is meant to enliven online shopping for prospective buyers. For instance, Gallery Furniture uses 48 cameras currently and plans to use more. Over 2 million pictures have been shipped on the Web site since its launch in March 1999. The Webcams, which span the 180,000-square-foot physical showroom, do more than add cinematic zest. They are part and parcel of the site's e-commerce infrastructure and perform the same purpose as an electronic inventory catalog would. Because inventory churns 70 times each year, instead of four or five times each year for most furniture stores, using live video is more economical. Visitors can zoom on cards affixed to each piece of furniture to see **prices** and **identification** numbers. Live video is also a desirable way to **finish** a transaction. For instance, one spouse may be in the store, while the other is logged in from a remote location. Galleryfurniture.com is still the exception, but another retailer testing the concept is Illinois Harley-Davidson Sales. According to an analyst, video feeds are of limited value when used by shoppers linked to low-bandwidth dial-up lines.

A discussion of 'infomediaries' in online e-commerce explains the way in which these sites enhance business-to-business online commerce by generating transaction fees. They conduct **auctions**, **match buyers** and **sellers** via request for proposals/quotation services, and engage in direct sales of merchandise, including books and software. Infomediary transaction fees will get larger as businesses do more commerce on the Internet, and as intermediaries are responsible for a larger percentage of e-commerce transactions. Intermediaries will be able to charge transaction fees ranging from 5 to 10 percent of the dollar amount of transactions **completed**. The market is expected to increase from \$38 million in 1998 to \$10.5 billion in 2002. Three factors will make business-to-business infomediaries popular with investors: a highly profitable business mode, rising barriers to entry, and a mammoth market opportunity. As the number of eyeballs viewing a specific infomediary increases, vendors will follow, and buyers will spend more where they find what they want and need. Operating costs are low for infomediaries, whose primary task is acquiring buyers and sellers. After an initial period spent attracting buyers and sellers and losing money, profits will rise quickly with each new customer. Infomediaries will be most useful for fragmented markets, where buyers and sellers do not easily find each other, and the most successful infomediaries will emphasize solving a specific problem for a particular

vertical market.

Abstract: Deregulation of telecommunications has meant an increase in third-party service provision, personalized service delivery and integrated networks and media. The efficient allocation of services, without human intervention, to satisfy advanced service requirements spanning several networks is a crucial task. This can be modeled as a winner determination problem in combinatorial **auctions** where there are multiple services, service providers and winner determination criteria (like cost, bandwidth, delay, etc) but we have shown the problem is NP- **complete** . The paper describes a new two-stage algorithm for optimal anytime winner determination. In the first stage, a hierarchical task network planner is used to decompose a task into subtasks that can be solved by the available services. In the second stage, a genetic algorithm with heuristics is used to find the optimal combination of service providers to provide the **services identified** . We present our algorithm used to solve the second stage in detail and the results from various experiments. The results show the GA finds optimal solutions much quicker than a modified depth-first search with pruning. We also show that the genetic algorithm: (a) finds optimal solutions quicker when deal lengths have a random distribution and (b) initial anytime performance is better when deal lengths have an exponential distribution. (10 Refs)

Descriptor Codes: 0310; 0708; 0505

Traditionally, the posted-price based electronic catalog process has served as the mechanism of choice for conducting electronic commerce activity on the web. Increasingly, *business auctions* are gaining popularity as an efficient and flexible on-line mercantile channel. We characterize the various dimensions of online *auctions* and focus our attention on the business-to-consumer (*B2C*) dimension. Typically, such *auctions* sell multiple-units of identical products. However, much of traditional *auction* theory has focussed on analyzing single-item *auctions*. We demonstrate the lack of applicability of single-item results in multi-item settings. We derive a general expression that characterizes the multiple equilibria that can arise in such *auctions* and segregate these into desirable and undesirable categories. Additionally, we show that number of such equilibria grows combinatorially with the number of items being sold.

Using empirical data from real-world online *auctions* we sift through the multitude of decision variables that *auctioneers* could control and **identify** the **bid**-increment as the key revenue impacting one.

We also present the first ever categorization of consumer bidding strategies in online *auctions*, and study the interaction between the bid-increment and such strategies. With a motive of providing concrete strategic directions to online *auctioneers* we derive an upper bound beyond which the bid-increment should not be set. Empirical evidence shows in retrospect that setting a bid increment higher than the upper bound has a negative impact on *auctioneer*'s revenue. **Finally**, we discuss a controlled laboratory experiment that utilizes salient monetary incentives and allows us to further test our analytical and empirical findings.

Essays on uncertainty with applications to economics

Author: Ozdenoren, Emre

Degree: Ph.D.

Year: 2000

Corporate Source/Institution: Northwestern University (0163)

Adviser: Peter Klibanoff
Source: VOLUME 61/06-A OF DISSERTATION ABSTRACTS INTERNATIONAL.
PAGE 2412. 125 PAGES
Descriptors: ECONOMICS, THEORY
Descriptor Codes: 0511
ISBN: 0-599-79842-4

In the first essay, which is coauthored with Ramon Casadesus-Masanell and Peter Klibanoff, we provide an axiomatic foundation for a maxmin expected utility over a set of priors (MMEU) decision rule in an environment where the elements of choice are Savage acts. This characterization complements the original axiomatization of MMEU developed in a lottery-acts framework by Gilboa and Schmeidler (1989). The novel axioms are formulated using standard sequence techniques, which allow cardinal properties of utility to be expressed directly through preferences.

In the second essay, I provide representation theorems for preferences where objects of choice are opportunity acts. The representations are additive over implicit state utilities and there is a unique implicit state space. I formulate an independence axiom for opportunity acts similar to Dekel, Lipman and Rustichini (1997). If I assume that the decision maker satisfies the independence axiom for all opportunity acts, I obtain an expected utility representation over explicit states. If I relax the independence axiom to C-independence and assume uncertainty aversion, as in Gilboa and Schmeidler (1989), I obtain a MMEU representation over explicit states.

In the **final** essay, I investigate the effect of changes in uncertainty and uncertainty aversion in a variety of trading mechanisms. In the first essay I have investigated a way to model preferences that allow for uncertainty aversion which is the MMEU model. In this **final** essay I apply MMEU to **auctions** and bargaining games. I consider a class of sealed bid **auctions** including first and second price **auctions**, and show that, as in the standard theory, bidders preferences over these **auctions** depend only on the reserve price. In a first **price auction**, I **identify** conditions under which uncertainty averse bidders raise their bids as uncertainty increases. Together with an analysis of seller behavior the above results enable me to conclude that under uncertainty aversion a first price **auction** Pareto dominates a second price **auction**. I also examine the effects of changes in uncertainty and uncertainty aversion on bidding behavior and gains from trade in take-it-or-leave-it offer and k-double **auction** bargaining.

CATTLE PRICE DISPERSIONS, SPATIAL RELATIONSHIPS, AND PRICE PREDICTIONS: A CASE STUDY OF SELECTED UNITED STATES CATTLE MARKETS

Author: MUWANGA, GERTRUDE SEBUNYA

Degree: PH.D.

Year: 1998

Corporate Source/Institution: UTAH STATE UNIVERSITY (0241)

Major Professor: DONALD L. SNYDER

Source: VOLUME 59/08-A OF DISSERTATION ABSTRACTS INTERNATIONAL.

PAGE 3116. 261 PAGES

Descriptors: ECONOMICS, AGRICULTURAL ; ECONOMICS, THEORY ; ECONOMICS, COMMERCE-BUSINESS

Descriptor Codes: 0503; 0511; 0505

This study investigated the nature of spatial price relationships and developed a rational expectations model based on the modified rational expectations hypothesis, the nature of price innovations, endogeneity/exogeneity relationships, the speed of adjustment, the nature

of price dispersions and their implications for market structure, and the effect of price dispersions/distribution characteristics on the forecast accuracy of alternative forecasting approaches.

The analysis indicated that cattle prices were integrated within classes for all the cattle classes and regions considered and that the law of one price (LOP) held in some instances but not in others. Deviations from LOP were both short-run and long-run phenomena. Price adjustments were either spontaneous or nonspontaneous depending on the region. The actual speed of adjustment varied depending on the regions, cattle classes, the source and direction of shock, and type of cattle. There were possible arbitrage opportunities for those regions where the adjustment was delayed. Prices in most regions had predictive power for each other. Prices were influenced by market specific characteristics (e.g., geographical location, market size), **auction** specific characteristics (e.g., number of lots at the **auction**), and cattle/lot specific characteristics (e.g., weight, sex, type of flesh, frame, breed). Monopsonistically competitive equilibria with price dispersions dominated the regular markets for cattle, while **auction** markets were dominated by monopolistically competitive equilibria with price dispersions, although cases of monopsonistically competitive and competitive equilibria with **price** dispersions were also **identified**. **Price** innovations were either temporary, persistent stable, or persistent explosive, depending on the region and cattle class. Price distribution characteristics significantly influenced the level with which prices could be forecasted. **Finally**, price expectations formulated, based on the "specified information set" of a simple optimal moving average, were rational.

PRICES IN DYNAMIC MARKETS (AUCTIONS)

Author: AVERY, CHRISTOPHER NORIO

Degree: PH.D.

Year: 1993

Corporate Source/Institution: STANFORD UNIVERSITY (0212)

ADVISER: ROBERT B. WILSON

Source: VOLUME 54/09-A OF DISSERTATION ABSTRACTS INTERNATIONAL.

PAGE 3546. 168 PAGES

Descriptors: ECONOMICS, THEORY; ECONOMICS, FINANCE; ECONOMICS,
COMMERCE-BUSINESS

Descriptor Codes: 0511; 0508; 0505

The essays in this dissertation study the theoretical origins of market prices. Their unifying motivation is to emphasize the dynamic nature of market adjustments and strategic interaction in models of price formation. Many recent game theory models have focused on the question of long-term price adjustments, but several benchmark models in different areas give a provocative result. When a competitor anticipates all possible consequences in choosing an initial action, market mechanisms tend to produce an immediate static equilibrium outcome without any need for adjustment or jockeying over time. These essays identify conditions that require dynamic effects to produce equilibrium **prices** and **identify** the implications of dynamic strategies on the efficiency of the resulting allocations and prices of goods. Chapter 2 studies the price outcomes in sequential bid **auctions** when competitors can jump the bid to attempt to intimidate opponents from subsequent competition, demonstrating that such aggressive bidding strategies can be rational and that they lead to implicit collusion on the part of the bidders against the **auctioneer**. Chapter 3 studies the path of prices when consumers arrive in sequence to buy or sell stock in a simplified financial market. Under certain conditions, a small number of sales can provoke a mass movement or herd of traders who ignore their information to incline themselves with the mood of

"the market. Herding can throw off the price in the short-run but must die out in the long-run. Chapter 4 argues that offers in two party negotiations provide option values if the recipient of an offer may receive new information while considering it. Then it may be optimal to make a conservative offer to minimize the option value, but that can lead to delayed agreements. Chapter 5 provides a general framework to explain the factors which lead to multiple equilibria and thus delayed agreements in the standard **complete** information bargaining model. Chapters 3, 4 and 5 are co-authored with Peter Zemsky.

ASSESSING THE PERFORMANCE OF REAL ESTATE AUCTIONS

Author: MAYER, CHRISTOPHER JOSEPH

Degree: PH.D.

Year: 1993

Corporate Source/Institution: MASSACHUSETTS INSTITUTE OF TECHNOLOGY (0753)

Supervisors: WILLIAM WHEATON; JAMES POTERBA

Source: VOLUME 54/06-A OF DISSERTATION ABSTRACTS INTERNATIONAL.

PAGE 2243.

Descriptors: ECONOMICS, GENERAL; URBAN AND REGIONAL PLANNING; ECONOMICS, FINANCE

Descriptor Codes: 0501; 0999; 0508

In a series of three papers, this dissertation studies the performance of real estate **auctions**. Chapter One develops a model that compares **auctions** and negotiated sales, giving predictions that are tested in subsequent empirical work. The paper shows that **auctions** sell property at a discount because a quick sale results in a "poorer" **match** between house and **buyer**, on average, than could be obtained by waiting longer for a buyer. Furthermore, the model predicts that **auction** discounts should rise in a down market with high vacancies and in a smaller market with fewer buyer and sellers, when there is a larger difference between houses. **Finally**, the **auction** discount falls when property is more homogeneous, because the **match** between **buyer** and house matters less in the **final** price.

The Second Chapter investigates the performance of real estate **auctions** in selling condominiums in the booming Los Angeles real estate market during the mid 1980's, finding that **auctions** perform quite well for the sellers. The study computes discounts by comparing the appreciation rate of **auction** properties, measured with resales of **auction** units, with a market resale price index. The paper also looks for price declines during the course of the **auction**, finding little evidence of bargains later in an **auction**.

To test the prediction that **auctions** sell real estate at a larger discount in a down market, Chapter Three looks at Dallas during the late 1980's. As predicted by the theory, **auction** discounts in Dallas are much larger than in Los Angeles. **Auctions** with a minimum price seem to sell at a lower discount than those utilizing an unpublished reserve, but the results are not conclusive. The data present little evidence of a price decline over the course of the **auction**. **Finally**, properties that "fall through" from the **auction** and are sold afterwards are found to sell at a large premium over their **auction** price. (Copies available exclusively from MIT Libraries. Rm. 14-0551, Cambridge, MA 02139-4307. Ph. 617-253-5668; Fax 617-253-1690.) (Abstract shortened by UMI.)

Industrial have-nots close gap

Wilson, Tim

InternetWeek , October 18, 1999 , n785 p1, 12, 2 Page(s)

ISSN: 0746-8121

Languages: English

Document Type: Articles, News & Columns

Geographic Location: United States

Discusses the upcoming launch this week of SupplierMarket.com, a marketplace that opens up business-to-business electronic commerce to all sizes and types of industrial manufacturers. Says that the site can be accessed for free with a Web browser and does not require supply chain, enterprise resource planning (ERP), or procurement software. Says that the company takes a two percent fee from the seller on all **completed** transactions. Indicates that the site is accessible to small and medium-sized manufacturers. Explains that the site enables buyers to write standardized requests for quotations (RFQs), review prequalified suppliers, and select suppliers after a **reverse auction**, while it enables **sellers** to **match** products with RFQs, participate in live bidding, and obtain contacts with minimal sales investment. Includes one photo and one table. (MEM)

Document Type: Articles, News & Columns

Geographic Location: United States

Profiles the business model of eBay, an online **auction** service. Says the service uses a person-to-person model of **matching sellers** and **buyers**, collecting a sliding fee on each transaction. Notes that problems created by customers complaining about other customers were resolved with a forum where customers could rate vendors, allowing the good ones to establish good reputations. Adds this was an important development for eBay, as its business model is based on being able to build trust between buyers and sellers. Says the company also negotiated an agreement with Parcel Plus for shipping services to customers, as a means of encouraging larger **transactions**. Includes one screen **display**, one sidebar, and one photo. (JC)

DOCUMENT TYPE: Working Paper
ABSTRACT INDICATOR: Abstract
ABSTRACT: This paper studies different explanations given for the "price
decline anomaly" in sequential **auctions**, a phenomenon also known as
the "afternoon effect". It surveys the dedicated theoretical models and
then explores the influence of the institutional or market
characteristics (of the sale) on the price trend. Next, it presents
different methods used for measuring **price** trends and analytically
identifies the differences between them. **Finally**, data from wine
auctions are used to show that different methods may lead to opposite
trends from the same data and that the number of identical objects
being sold influences the price trend.

TITLE: Reputation Selling in Feeder Cattle Teleauctions

AUTHOR(S): Turner, Steven C.; McKissick, John; Dykes, Nancy S.

AUTHOR(S) AFFILIATION: U GA; U GA; U GA

JOURNAL NAME: Review of Agricultural Economics,

JOURNAL VOLUME & ISSUE: 15 1,

PAGES: 9-19

PUBLICATION DATE: January 1993

DOCUMENT TYPE: Journal Article

ABSTRACT INDICATOR: Abstract

ABSTRACT: Recent research to identify significant factors that influence
feeder cattle prices has focused on cattle and market characteristics.
The research reported here used data from Georgia teleauctions during
the 1977 to 1988 period to determine the possible impact of seller's
reputation on price. Both significant premium and discount **sellers**
were **identified** for two of the three teleauction organizers. The
teleauction organization that transferred the least amount of
information about the cattle had the greatest number of reputation
sellers while the organization with the most information about sellers'
cattle given to buyers registered no significant seller reputations.
Reputations can help buyers estimate quality in the absence of
complete information.
